Outline Site Description
Cliff section.

Geological System/Age and Primary Rock Type
Growth fault within the Upper Carboniferous (Namurian) sandstone, siltstone and mudstone of the Central Clare Group.

Main Geological or Geomorphological Interest
A spectacular growth fault can be seen in the cliff face at Foohagh Point. A growth fault is a fault that moves at the same time as sediment is being deposited causing the sediment to thicken towards the fault. The growth fault at Foohagh Point displaces sandstones, siltstones and mudstones within the fourth cyclothem sequence of the Upper Carboniferous (Namurian) Central Clare Group. The pale coloured sandstones of this formation display clear thickening towards the fault.

Site Importance
This site is of National Importance and may be proposed as an NHA under the IGH 9 Upper Carboniferous and Permian theme of the GSI’s IGH programme.

Management/promotion issues
None.
